About CMS

A Content Management System (CMS) is a software system used for the management of computer files, image media, audio files, electronic documents and web contents. A Wireless CMS in contrast is administered through a mobile device wirelessly.

Advantages Of CMS

- Quick development and deployment time: Using a CMS can drastically speed up the process of developing a site;
- Open source CMSs are free to download and install;
- Advanced site functionality: Most systems allow the implementation of functionalities (forms, polls, quizzes, event calendars, etc.) that would otherwise be extremely hard to achieve;
- User-friendly: Gives people with little or no technical skills the ability to create, update or modify content;
- Reduces costs: Implementing an out-of-the-box CMS is definitely less costly than a custom one. Also, after users have learned some of the ins and outs of the CMS, they will be able to handle the basic functions on their own, and this reduces the costs of outside technical assistance as well;

Disadvantages Of CMS

- Hidden implementation costs for perfecting the system for users' needs;
- Server resources: Some CMSs (e.g. Joomla) can put a load on your server resources;
- Some technical skillset requirements: If users have an aversion to learning the basics of using a CMS, the usage of a CMS will not be as efficient. This means that hiring experienced staff or contracting technical help might be necessary;
- Maintenance: In the wrong hands, an unmaintained and outdated CMS can do a lot of harm to a website and lead to serious security vulnerabilities;
- Direct support: for community-based CMS systems, direct support may not be easy to find, and you have to rely on user forums and existing documentation.
